

G6: DREAM HOME SYSTEM

AI DECLARATION

Required Information	Description
AI tool used	ChatGPT and Gemini
Purpose of use	Code suggestion for complex backend logic, database schema design, and error debugging.
Sample prompts used	Prompt 1 (Migrations): "Create a Laravel 11 migration for a properties table in our Dream Home system. It needs foreign keys linking it to the branches table and owners table with cascade on delete." Prompt 2 (Models): "Write the Eloquent model relationships for the Owner model. A private owner can own many properties, but a property only belongs to one owner." Prompt 3 (Controllers): "Show me how to write a Laravel CRUD controller store method for saving a new property listing, including validation for price and address." Prompt 4 (Debugging): "I am getting a 'Foreign key constraint is incorrectly formed' error when running php artisan migrate. Here are my two migration files. How do I fix this?"
Output used	Adopted: The basic database migration structures and model relationship functions (hasMany and belongsTo). Revised: We modified the controller validation rules to strictly match our exact project requirements and field names. Rejected: Some overly complex UI styling and generic route suggestions that didn't fit our specific project layout.
Student reflection	Using AI taught us how Laravel links tables together using models and foreign keys much faster than searching documentation manually. It also helped us understand how to read error logs. We verified the results by running the migrations successfully in our database, testing the CRUD forms in the browser, and making sure data was accurately saved without errors.
